DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3,9 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Ohno et al(3621640).

Ohno et al teaches a dust collecting container(6) for a vacuum cleaner, removably mounted in a suction chamber of a vacuum cleaner body to filter a dust from a dust laden air being drawn into the suction chamber through an air suction hole(44) that is connected with the outside, the dust collecting container comprising a dust collecting casing comprising a connecting hole(3) connected with the air suction hole and a discharge portion for discharging the drawn air and a filter assembly(5) comprising at least three filters(16,13a,13b) and removably mounted at the discharge portion(see figures 3 and 4). Ohno et al et al further teaches wherein the filter assembly comprises a first, a second, and a third filter which are porous in nature and provided in consecutive order, the pores of the second filter(napped cloth 13b) being smaller than the first filter(prefilter 16), the pores of the third filter(elastic sheet) being smaller than the second filter(column 4 lines 17-22), and the dust laden air drawn in through the connecting hole passes through the first, second, and third filters in turn. Ohno et al further teaches wherein the first filter is a net member(column 3 line 30). Ohno et al

Art Unit: 1724

further teaches the dust collecting casing is provided with an extended portion formed on the connecting hole, the extended portion being provided with a sealing means(check valve 45) for sealing in between the air suction hole and the connecting hole.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-5,15 are rejected under 35 U.S.C. 102(e) as being clearly anticipated by Fawcett(2004/0205926).

Fawcett teaches a dust collecting container(30) for a vacuum cleaner , removably mounted in a suction chamber of a vacuum cleaner body to filter a dust from a dust laden air being drawn into the suction chamber through an air suction hole(22) that is connected with the outside, the dust collecting container comprising a dust collecting casing comprising a connecting hole(56) connected with the air suction hole and a discharge portion for discharging the drawn air and a filter assembly(68) comprising at least three filters(76,68; paragraph 0036) and removably mounted at the discharge portion(see figures 3 and 4). Fawcett further teaches wherein the filter assembly comprises a first, a second, and a third filter which are porous in nature and provided in consecutive order, the pores of the second filter(spun bound polyester) being smaller than the first filter(screen prefilter 76), the pores of the third filter(melt blown polypropylene) being smaller than the second filter, and the dust laden air drawn in through the connecting hole passes through the first, second, and third filters in turn.

Art Unit: 1724

Fawcett further teaches wherein the first filter is a net member. Fawcett further teaches wherein the second filter is a sponge(paragraph 0036, noting that the filter can be formed of any number of materials). Fawcett further teaches wherein the third filter is a non-woven fabric(melt-blown polyester). Fawcett further teaches wherein the dust collecting container is made of a transparent material.

Applicant cannot rely upon the foreign priority papers to overcome this rejection because a translation of said papers has not been made of record in accordance with 37 CFR 1.55. See MPEP § 201.15.

Allowable Subject Matter

Claims 6-8,10-14 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim 6 recites "wherein the third filter comprises: an outer frame disposed in close contact with a boundary of a discharge portion of the dust collecting casing; and a non-woven fabric provided at the outer frame, defining a fluid passage through which the air is discharged from inside of the dust collecting casing to the outside and at the same time filtering minute particles from the air passed through the second filter". Both Ohno et al and Fawcett teach a third filter, however the third filter is not a separate filter which includes an outer frame, but is a filter having a different mesh size than a second filter, the second and third filters placed together to form a single filter. It would not have been obvious to someone of ordinary skill in the art at the time of the invention to provide a third filter which comprises an outer frame disposed in close contact with a

Art Unit: 1724

boundary of a discharge portion of the dust collecting casing; and a non-woven fabric provided at the outer frame, defining a fluid passage through which the air is discharged from inside of the dust collecting casing to the outside and at the same time filtering minute particles from the air passed through the second filter because neither Ohno et all nor Fawcett teach such a modification. Claims 7,8, and 13 depend on claim 6 and hence would also be allowable upon incorporation of claims 6 and 2 into claim 1.

Claim 10 recites "wherein the sealing means comprises: a first sealing member, extended at one end toward the outer side of the extended portion to a close contact with a boundary of the air suction hole; and a pressing means for selectively pressing the first sealing member towards the air suction hole". Ohno et al teaches a check valve seal, but fails to teach a first sealing member, extended at one end toward the outer side of the extended portion to a close contact with a boundary of the air suction hole; and a pressing means for selectively pressing the first sealing member towards the air suction hole. It would not have been obvious to someone of ordinary skill in the art at the time of the invention to provide a first sealing member, extended at one end toward the outer side of the extended portion to a close contact with a boundary of the air suction hole; and a pressing means for selectively pressing the first sealing member towards the air suction hole because Ohno et al does not suggest such a modification. Claims 11 and 12 depend on claim 10 and hence would also be allowable upon incorporation of claims 10 and 9 into claim 1.

Claim 14 recites "wherein the dust collecting casing is provided with a fixing rail at an outer portion thereof in correspondence with a fixing rib provided to a suction

Page 6

Application/Control Number: 10/625,922

Art Unit: 1724

chamber of the cleaner body, and the dust collecting casing is mounted in the suction chamber as the fixing rib is inserted in the fixing rail". Both Ohno et al and Fawcett teach dust collecting casings having an end portion which presses into the air suction hole and places the casing within the suction chamber. It would not have been obvious to someone of ordinary skill in the art at the time of the invention to provide a dust collecting casing which is provided with a fixing rail at an outer portion thereof in correspondence with a fixing rib provided to a suction chamber of the cleaner body, and the dust collecting casing is mounted in the suction chamber as the fixing rib is inserted in the fixing rail because neither Ohno et al nor Fawcett teach such a modification.
